Extending the display

NOTE: Computer is set to default to Duplicate mode.

First step should always be to check to make sure you are on the correct Mode (Duplicate or Extend) using the Windows + P keys on the keyboard. **Not doing this can result in losing the mouse pointer.**

Why would I do this?

- Extending the display will allow you to have PowerPoint notes on the PC monitor, while displaying the slides on another display source (Projector/TV). See [Scenarios](#) for instructions.

- If you want to display one window/application on the projector source and separate windows/applications on the other display sources.

See below for examples

To use Extended monitors:

1. On the keyboard, click the Windows Key + P and select Extend.

2. On the touch panel choose **PC Ext. Desktop 1** to allow side and rear sources to become additional monitors for content overflow from PC Main. (This would emulate 2 monitors)

3. Choose **PC Ext. Desktop 2** to allow side and rear sources to become additional monitors for content overflow from PC Main and PC Ext. Desktop 1. (This would emulate 3 monitors)

Any of the sources can become the extended displays - you may have to play around with the settings to determine which setup works best for you.

Main display (Projector will show PC Main contents/**monitor 1**, Rear source will become PC Ext. Desktop 1/**monitor 2**, Side source will become PC Ext. Desktop 2/**monitor 3**). **Drag windows to the left to view them on the extended displays/desktops.**

- ○ Example 1: YouTube video on Side source, PowerPoint on Projector source, and website/image on Rear Source.

- ○ Example 2: Website window on Projector source, another website window on Rear source and Side source (**Touch panel settings** - Projector/PC Main, Rear/PC Ext. desktop 1, Side/PC Ext. desktop 1 - See image below to see what this looks like on the touch panel)
